

# DOES EVERYTHING CHANGE?

ALL THOSE WHICH ARE COMMON TO ALL CAN NEVER BE CHANGED

*Can't a property that is identified through a thing also be identified through any other thing?*

*This writing is dedicated to all those who argue that*

**EVERYTHING CHANGES & NO PROPERTY IS COMMON**

***Does everything change? Is no property common to all?***

*Divisibility is one of the unchanging, common, indestructible properties.*

*All those which are common to all are universals.*

*No change can change the universals and make things devoid of universals.*

***All those having nothing to compare cannot compare and study things.***

*All those which are common to all cannot be identified by those having no thing to compare.*

**Is there no need to know all those which are common to all?**

If we are a part of all, and the ones who are common with all, would be the same then us, this would mean *knowing us is knowing them*. Yes, there is a need to know ourselves as if we know ourselves we can understand and know others. We can easily understand others if we learn to understand ourselves.

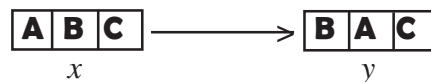

**READ THIS IF YOU GET CONFUSION WHILE READING THE FOLLOWING PAGES**

You are supposed to say that ONE is changed only if ONE becomes NOT ONE. Study this illustration in order to get rid of future confusions.

Let  $x = \boxed{\mathbf{A}} \boxed{\mathbf{B}} \boxed{\mathbf{C}}$

Let  $y = \boxed{\mathbf{B}} \boxed{\mathbf{A}} \boxed{\mathbf{C}}$

Let us consider a change in which  $x$  is changed to  $y$  -  $\boxed{\mathbf{A}} \boxed{\mathbf{B}} \boxed{\mathbf{C}}$  is changed to  $\boxed{\mathbf{B}} \boxed{\mathbf{A}} \boxed{\mathbf{C}}$

One could identify that **A** remains as **A**, **B** remains as **B**, **C** remains as **C** and the order in which **A** and **B** exist in  $x$  alone changes in the change from  $x$  to  $y$ .

One is supposed to say that '**A** is changed' only if **A** becomes 'NOT **A**'. It is inappropriate to say that '**A** changes' when **A** remains as **A**. Does **A** become 'NOT **A**' in the change from  $x$  to  $y$ ?

One is supposed to say that '**B** is changed' only if **B** becomes 'NOT **B**'. It is inappropriate to say that '**B** changes' when **B** remains as **B**. Does **B** become 'NOT **B**' in the change from  $x$  to  $y$ ?

It is also inappropriate to say that everything changes in the change from  $x$  to  $y$ , because it will contradict with the facts: **A** remains as **A**, **B** remains as **B**, and **C** remains as **C**. It is absurd to make statements like **A** changes to **A** or **B** changes to **B**. **A** changes **A** to a means that **A** remains **A** as only.

The appropriate saying would be that 'the order alone changes in the change from  $x$  to  $y$ ' or 'everything except the order in remains the same in the change from  $x$  to  $y$ '.

**What is not common to  $x$  and  $y$ ?** The order in which **A**, **B**, and **C** exist in  $x$  does not exist in  $y$ . The order in which **A**, **B**, and **C** exist in  $y$  does not exist in  $x$ . The order in which **A**, **B**, and **C** exist in  $x$  and  $y$  is not common to  $x$  and  $y$ .  $x$  and  $y$  differ in the order in which **A**, **B**, and **C** exist in them. The *order* in which **A**, **B**, and **C** exist in  $x$  and  $y$  alone changes in the change from  $x$  to  $y$ .

'Everything which changes'  $\neq$  'Everything changes'

'Everything which do not change'  $\neq$  'Everything do not change'

'Everything is subjected to change'  $\neq$  'Everything changes'; 'Independent'  $\neq$  'Isolated'

'A'  $\neq$  'order of A'. There is a difference between A and order of A.

'Constant change'  $\neq$  'Constants of change'; 'Constant motion'  $\neq$  'Constants of motion'

'Different things'  $\neq$  'Difference between things'; 'Making different'  $\neq$  'Making a difference'

**'Difference in the order of identification of properties'  $\neq$  'Difference in the properties'**

## Preface

Can't a property that is identified through a thing also be identified through any other thing? How can a property like divisibility that is identified through a thing also be identified through the others, if everything changes? Does everything change? Is a property nothing?

Students are constantly misinformed that "everything changes." The propaganda that "everything changes" is propagated by individuals who want to 'prove and maintain' their 'sovereign intellectual supremacy' by tampering the normal intellectual development of their fellowmen and women. How does the propaganda "everything changes" tamper the normal human intellectual development? **The statement "everything changes" directly instructs the learners not to look for the things which remain the same** like the ideas with which everything is questioned, the universals, the logic, and the other analytical principles. The statement that "everything changes" is true only to those who have no capacity to identify those which are common to all. No property is a common property to those who have no capacity to identify and compare the properties of more than one thing. **Students may find this writing useful in** identifying the properties which correspond to the ideas with which everyone searches, identifies, classifies, relates, questions, studies, describes and explains the different things.

Can one identify and prove that  $x = x$  if the things by which everything is identified do not remain the same? Can one identify and prove that  $x \neq y$  if the things by which everything is identified change? One could identify and prove that "every constant is a variable" if the things by which everything is identified do not remain the same. One can never identify things without the things to identify them. **Why can't one identify those which change without those which do not change?**

This writing is to refute the statement that everything changes. One who attempts prove that "everything changes" can identify nothing and prove no thing through search and research. **You can never identify that which you search for if no thing remains the same.** No one can ever prove that which can never be the same.

The statement "everything changes" is set to impeach the first principle of science that "the total energy of the universe remains the same." No thing can be changed except the order in which those which can neither be created nor be destroyed exist. **Every thing except the order remains the same.** Everything except the order can never be disordered. No thing can be conserved if everything changes.

All those who aspire to prove that "everything changes" must **abolish the universals, constants, logic, and other analytical principles of science and philosophy.** All those who aspire to prove that "those which change can be identified without those which do not change" must abolish the ideas with which everyone searches, identifies, classifies, relates, questions, studies, describes, comprehends and explains the different things. The statement "everything changes" is expressed as a constant and cancels itself out if there are no constants. The statement that 'everything changes' is true until those which do not change are identified.

**Is no thing common to all?** Can any two things be without similarity? No two things can be without similarity. The similarities among all things can never be destroyed. **One who advocates that "everything changes" denies the similarities which are common to all.** One needs *the theory of constants* and *invariantology* in order to study and explain why those which are common to all can never be changed.

## CONTENTS

1. The ideas on a one and all the others correspond to the properties identified through them 9 - 149
2. Why do the ideas remain the same? 150
3. Everything except the order remains the same 151 - 157
4. Analytical thinking 158
5. Thinking analytically is a capacity we all have 159

*One who has no capacity to make students identify and systematically use their analytical thinking capacity is not a teacher.*

*One who has no capacity to identify and systematically use the analytical thinking capacity is not an analyst.*

*The system which has no capacity to make students identify and systematically use their analytical thinking capacity is not academic system.*

**Can't a property that is identified through a thing also be identified through any other thing?**

*The ideas on a one and all the others correspond to the properties identified through them.*

**Don't the ideas and questions correspond to the properties - divisibility, comparability, connectivity, interactivity, recombability, redistributability, ...?**

*“Is it a divisible one? What are its parts, if it is a divisible one? Can it be divided into equal parts? What are the differences and similarities among its parts? How are its parts related? How are its parts interactive? Can its parts be recombined? Can its parts be redistributed? Is it a determinant? Is it fulfilling the requirements? Is it a reliable one? What are its preferences?...”*

**THE PROPERTY IDENTIFIED THROUGH A ONE IS NOT COMMON ONLY IF IT IS NOT IDENTIFIED THROUGH ANY OTHER ONE**

*Nothing can be searched to find the property which has not been identified through anyone.*

*Research is the search to find whether the property identified through a one is common to all or not.*

*All those which are common to all cannot be identified by those having no thing to compare.*

*One may tend to say that “a thing can be compared with itself as it changes.” This statement is a fallacy. ‘x’ becomes ‘not x’ when ‘x’ changes. Are ‘x’ and ‘not x’ the same thing? ‘x’ and ‘not x’ are different things.*

### **What is the need for analytical thinking?**

Thinking analytically is a capacity we all have. Analytical thinking becomes essential because our world and issues around us are extremely complex with numerous inter-relationships and inter-dependence like several threads intertwined into a complex ball. These threads need to be separated in our mind through analytical thinking so that we can apply our process of logic correctly and efficiently to achieve the desired outcome for which the thinking process has been undertaken. In the absence of analytical thinking, our thought and decision process would become a bundle of confusion leading to wrong or incomplete conclusions!

**DON'T THE IDEAS UPON WHICH THESE QUESTIONS ARE BASED REMAIN THE SAME?**

---

*Everything except the order can never be disordered.*

*No one can identify those which change without those which do not change.*

---

The ideas with which one questions, studies, relates, comprehends, describes, and explains each and every thing remain the same because *no change can produce that which cannot be*:

1. as a part,
2. as a whole,
3. as an equivalence,
4. as a uniqueness,
5. as a limit,
6. as a link,
7. as a sensation,
8. as a influence,
9. as an origin,
10. as a derivative,
11. a determinant,
12. an expression,
13. as an intent, and
14. as a fulfillment.

#### **How do one's ideas relate things?**

One's ideas can relate a thing to the other things:

1. as a part,
2. as a whole,
3. as an equivalence,
4. as a uniqueness,
5. as a limit,
6. as a link,
7. as a sensation,
8. as a influence,
9. as an origin,
10. as a derivative,
11. a determinant,
12. an expression,
13. as an intent, and
14. as a fulfillment.

Nothing can be studied without asking questions.

What do science and philosophy answer for if not for questions?  
If you keep the questions out then the questions will keep you out.

Everything can be questioned in the way one is questioned.  
Everything can be explained in the way one is explained.

Every teaching is insignificant if no idea remains the same.  
Every plan or research is insignificant if nothing remains the same.  
Your thoughts are not common only if no one else could think them.

**Order** is that which can be disordered. **Invariant** is that which can never be disordered. **Invariants** can neither be created nor be destroyed. No order can be formed without disorder. What would be formed if a thing disorders? A new order will be formed with the deformation of the existing the order. Everything except the order will remain the same.

- ~ What would be formed if one is in isolation?
- ~ What would be formed if A reacts with B?
- ~ What would be formed if organism A is crossed with organism B?
- ~ What would be formed if gene A is recombined with gene B?

- ~ What would be formed if you cut yourself?
- ~ What would be formed if you cheat yourself?

**Information tells what  
is in formation!**

The *possible orders* which can be formed when a thing disorders can be found from the possible ways the characteristic components segregate and recombine. What is the *most probable order* which can be formed can be found from the degree of preference for every possible order. The absence of preference for any order is the random condition. Under random condition, every possible order is equally probable.

**The science of genetics** deals with the inheritance of characteristics, i.e., transfer of characteristics from one generation to next generation. No transfer or recombination can occur without disorder of the existing order of the units of inheritance. The science of genetics neither deals with the *ab initio* genesis of characteristics nor deals with the genesis of units of inheritance.

**The science of thermodynamics** deals with energy transfers and transformations. No transfer or recombination can occur without disorder existing orders (forms) of energy. It categorically states that energy can neither be created nor be destroyed.

**The science of permutation & combinations** deals with the computation of the possible orders which can be formed through disorders.

**The science of probability** deals with the computation of the degree of preference for every possible order which can be formed through disorders.

**Which one will remain forever?** One would find two contradictory answers to this question.

1. Anything *which cannot be changed* will remain forever. (thermodynamic version)
2. Anything *which is flexible* will remain forever. (evolutionary theory version)

In the thermodynamic version, stability is related to energy and probability. Lesser the energy is more the stability. The stable one is the probable one. The probable one is the stable one. In evolutionary theory version, one that adapts to every condition will be selected while the other will be eliminated.

In order to identify the preference for every possible order which would be formed through disorders, one needs the knowledge of: 1. the rate of disorder, 2. the route of disorder, 3. the extent of disorder, and 4. the direction (the order towards which a disorder progresses) of disorder.

In order to identify the preference for every possible order which would be formed through a change, one needs the knowledge of:

1. the rate of change (number of changes per step of change),
2. route of change,
3. direction of change, and
4. extent of change.

In order to identify the preference for every possible order which would be formed through a chemical reaction, one needs the knowledge of:

1. the rate of a chemical reaction,
2. route of a chemical reaction,
3. direction of a chemical reaction, and
4. extent of a chemical reaction.

In order to identify the preference for every possible order which would be formed through electron flow, one needs the knowledge of:

1. the rate of electron flow,
2. route of electron flow,
3. direction of electron flow, and
4. extent of electron flow.

In order to identify the preference for every possible order which would be formed through energy flow, one needs the knowledge of:

1. the rate of energy flow,
2. route of energy flow,
3. direction of energy flow, and
4. extent of energy flow.

In order to identify the preference for every possible order which would be formed through blood flow, one needs the knowledge of:

1. the rate of blood flow,
2. route of blood flow,
3. direction of blood flow, and
4. extent of blood flow.

In order to identify the preference for every possible order which would be formed through growth, one needs the knowledge of:

1. the rate of growth,
  2. route of growth,
  3. direction of growth, and
  4. extent of growth.
-

In order to identify the preference for every possible order which would be formed through a process, one needs the knowledge of:

1. the rate of a process,
2. route of a process,
3. direction of a process, and
4. extent of a process.

In order to identify the preference for every possible order which would be formed through replication, one needs the knowledge of:

1. the rate of replication,
2. route of replication,
3. direction of replication, and
4. extent of replication.

In order to identify the preference for every possible order which would be formed through transcription, one needs the knowledge of:

1. the rate of transcription,
2. route of transcription,
3. direction of transcription, and
4. extent of transcription.

In order to identify the preference for every possible order which would be formed through translation, one needs the knowledge of:

1. the rate of translation,
2. route of translation,
3. direction of translation, and
4. extent of translation.

In order to identify the preference for every possible order which would be formed through a production, one needs the knowledge of:

1. the rate of production,
2. route of production,
3. direction of production, and
4. extent of production.

In order to identify the preference for every possible order which would be formed through a propagation, one needs the knowledge of:

1. the rate of propagation,
2. route of propagation,
3. direction of propagation, and
4. extent of propagation.

In order to identify the preference for every possible order which would be formed through error, one needs the knowledge of:

1. the rate of error,
2. route of error,
3. direction of error, and
4. extent of error.

In order to identify the preference for every possible order which would be formed through recombination, one needs the knowledge of:

1. the rate of recombination,
  2. route of recombination,
  3. direction of recombination, and
  4. extent of recombination.
-

In order to identify the preference for every possible order which would be formed through a transfer, one needs the knowledge of:

1. the rate of transfer,
2. route of transfer,
3. direction of transfer, and
4. extent of transfer.

In order to identify the preference for every possible order which would be formed through conservation, one needs the knowledge of:

1. the rate of conservation,
2. route of conservation,
3. direction of conservation, and
4. extent of conservation.

In order to identify the preference for every possible order which would be formed through movement, one needs the knowledge of:

1. the rate of movement,
2. route of movement,
3. direction of movement, and
4. extent of movement.

In order to identify the preference for every possible order which would be formed through displacement, one needs the knowledge of:

1. the rate of displacement,
2. route of displacement,
3. direction of displacement, and
4. extent of displacement.

In order to identify the preference for every possible order which would be formed through reproduction, one needs the knowledge of:

1. the rate of reproduction,
2. route of reproduction,
3. direction of reproduction, and
4. extent of reproduction.

In order to identify the preference for every possible order which would be formed through evolution, one needs the knowledge of:

1. the rate of evolution,
2. route of evolution,
3. direction of evolution, and
4. extent of evolution.

In order to identify the preference for every possible order which would be formed through a progress, one needs the knowledge of:

1. the rate of progress,
2. route of progress,
3. direction of progress, and
4. extent of progress.

**The science of calculus  
deals with rates of disorder.**

In order to identify the preference for every possible order which would be formed through a transition, one needs the knowledge of:

1. the rate of transition,
  2. route of transition,
  3. direction of transition, and
  4. extent of transition.
-

In every disorder, one could identify 1. a state of initiation, 2. the states of progression and 3. a state of termination. The initial and final states are called as boundary states. The states of progression are called as transition states.

For examples,

In the case of a chemical reaction, one could identify:

1. reaction initiation (initial state),
2. reaction progression(through transition states) and
3. reaction termination (final state).

In the case of replication, one could identify:

1. replication initiation (initial state),
2. replication progression(through transition states) and
3. replication termination (final state).

In the case of transcription, one could identify:

1. transcription initiation (initial state),
2. transcription progression(through transition states) and
3. transcription termination (final state).

In the case of translation, one could identify:

1. translation initiation (initial state),
2. translation progression(through transition states) and
3. translation termination (final state).

In the case of glycolysis, one could identify:

1. glycolysis initiation (initial state),
2. glycolysis progression(through transition states) and
3. glycolysis termination (final state).

In the case of disease, one could identify:

1. disease initiation (initial state),
2. disease progression(through transition states) and
3. disease termination (final state).

In the case of a calculation, one could identify:

1. calculation initiation (initial state),
2. calculation progression(through transition states) and
3. calculation termination (final state).

In the case of a recombination, one could identify:

1. recombination initiation (initial state),
2. recombination progression(through transition states) and
3. recombination termination (final state).

In the case of a discussion, one could identify:

1. discussion initiation (initial state),
2. discussion progression(through transition states) and
3. discussion termination (final state).

In the case of a war, one could identify:

1. war initiation (initial state),
  2. war progression(through transition states) and
  3. war termination (final state).
-

One can never identify those which change without those which do not change. In every experimental design, the system under study will be disturbed [changed], and then those which change will be identified with those which do not change. The components which can be disordered are *called as* characters. The components which cannot be disordered are *called as* characteristics. Every characteristic is an invariant. A characteristic is that without which a thing cannot be characterized and identified. One may change. But, the characteristics without which one cannot be identified will never change.

### The Experimental Design:

- Change/disturb and identify those which change and which do not change.

- ~ Scratch the gold & identify those which change and those which do not change.
- ~ Feed yourself & identify those which change and those which do not change.
- ~ Poison yourself & identify those which change and those which do not change.
- ~ Hang yourself & identify those which change and those which do not change.
- ~ Feed the organism & identify those which change and those which do not change.
- ~ React the atom & identify those which change and those which do not change.
- ~ React the molecule & identify those which change and those which do not change.
- ~ Mutate the gene & identify those which change and those which do not change.
- ~ Feed the organism & identify those which change and those which do not change.
- ~ Kick the pot & identify those which change and those which do not change.
- ~ Chase the dog & identify those which change and those which do not change.
- ~ Love a girl & identify those which change and those which do not change.
- ~ Cut the throat & identify those which change and those which do not change.
- ~ Cheat the people & identify those which change and those which do not change.

.  
.  
.

**The Research Design:-** Search, identify and list all the possibilities. Find the probability for every possibility. *Re-search* and identify the possibility which has the highest probability. One which has the highest probability is *the most probable outcome*.

#### Is it difficult to comprehend?

Pressure develops when flow is blocked/resisted.  
 Water pressure develops when water flow is blocked.  
 Electric pressure develops when electron flow is resisted.  
 Osmotic pressure develops when osmotic flow is blocked.  
 Psychological pressure develops when psychological flow is blocked.  
 Social pressure develops when social flow is blocked.

...

The object and its properties can be identified from the image of the object.  
 [*The principle of spectroscopy*]

The things which move identically under all conditions can never be separated. Make the things to move by the application of a driving force and separate them if there is a difference in their moves! [*The principle of all separation techniques*]

Uncertainty is in the measurement, but not in substance.

Some say that everything is random. Randomness is the absence of preference. No plan or experiment is significant if everything is randomness. Don't you have any preference in your life?

**DON'T THESE IDEAS REMAIN THE SAME?**

Thinking of thoughts as like little threads is one way of looking at things. But the idea that people could hold "between 4 and 8" thoughts in mind at once has been fairly well debunked, or at least abandoned. It's actually far simpler, more like 2 or 3, and the complexity of the rest of it comes from the relevance of what your attention is on to what is in the rest of your mind.

I wouldn't say humans are like computers, but you only need to look at assembly language to see how the most complex things can be accomplished by very simple methods, with only 2 or 3 things "in mind" at once.

For instance, assemblers aren't focused on variables and such like higher-level languages; there are generally 2 or 3 "registers," usually called ax, bx and dx, that are each assigned numerical values. There's often a special counting register, cx, also, but the main three do practically everything. For instance suppose your language has an operation "mul" that multiplies bx and dx, and stores the result in ax:

```
set bx,2
set dx,4
mul
```

At this point the ax register will have the value 8. Endless reams of assembly code can be written using just basically those three "ideas."

The human mind can do the same thing, more or less.

Suppose you've got an output port, port 2, that takes the number given it and writes it on the screen. Then you could write

```
set cx,100
set dx,2
set bx,2
:startloop
mul
out 2,ax
set bx,ax
loop startloop
```

It will run through that loop 100 times, and print out the first 100 powers of 2.

The human mind can do things just as simply. If you learned all the basic multiplication and division tables in school, you can do long division in your head by just using three similar "registers" and the imprinted memory of the process. (the "code.")

Hold the numerator and denominator in mind, calculate the dividend from memory of multiplication tables, and say it so it sticks in your verbal memory. Then calculate the remainder and discard the original numerator, replacing it in your mind with the remainder; add a zero on the remainder, cause you're calculating the next decimal place, and repeat the process. Remember the denominator stays the same; all you need to do is juggle numerator, dividend and remainder with the same simple algorithm. Practice and you can do it real fast. It helps if you visualize doing it on paper with the old-style method of the division box that looks similar to the square-root symbol.

That's all analytical thinking is, really ... breaking down what is initially too complex to fathom, and finding what is simple about it.

---

Thinking analytically is a capacity we all have. People who refuse this statement either believe they are analytical thinkers and like to be special so they don't like the idea of having other people be special so easily or they believe themselves to be inferior to other people are not able to see their own potential on analytical thinking.

It is an obvious fact that the present day academic system completely failed in promoting analytical thinking. The system which has no capacity to make students aware of their analytical thinking capacity cannot be called as academic or educational system. Such academic systems can never prepare students who can bring out public understanding and social harmony. Public understanding and social harmony cannot be brought without promoting analytical thinking.

**If everything changes, then the idea that "everything changes" must also change, and so everything doesn't change: otherwise the idea that everything changes would also mean that everything doesn't change.**

*One who has no capacity to make students identify and systematically use their analytical thinking capacity is not a teacher.*

*One who has no capacity to identify and systematically use the analytical thinking capacity is not an analyst.*

*The system which has no capacity to make students identify and systematically use their analytical thinking capacity is not academic system.*

**Don't all of us have the analytical thinking capacity?**

**ALL THOSE WHICH ARE COMMON TO ALL CAN NEVER BE CHANGED**  
*All those which are not common to all can only be changed*

*The statement that “everything changes” is true only to those who have no capacity to identify those which are common to all.*

Thinking analytically is a capacity we all have. Analytical thinking becomes essential because our world and issues around us are extremely complex with numerous inter-relationships and inter-dependence like several threads intertwined into a complex ball. These threads need to be separated in our mind through analytical thinking so that we can apply our process of logic correctly and efficiently to achieve the desired outcome for which the thinking process has been undertaken. In the absence of analytical thinking, our thought and decision process would become a bundle of confusion leading to wrong or incomplete conclusions!

Students may find this writing useful in identifying the properties which correspond to the ideas with which everyone searches, identifies, classifies, relates, questions, studies, describes and explains the different things.

**Can't a property that is identified  
through a thing also be identified through any other thing?**

#### **ABOUT THE AUTHOR**

SIVASHANMUGAM, founder of Invariantology & Uniformatics, President of Intellectual Development Foundation, has everything which every human can have. He received his formal education from Bishop Heber School, Kongunadu Arts & Science College and Jawaharlal Nehru University. Sivashanmugam teaches biophysical chemistry. He loves open sea diving and travelling in the west cost of India. He continues life with fine human senses. He tells good moral stories to children. He tries not to loose his love and affection for children and students. Sivashanmugam is to thank all his teachers for not teaching the art of begging and brainwashing. Sivashanmugam instituted Intellectual Development Foundation in order to develop methods to promote analytical thinking in order to save the soul of academics from death in the authoritarian hands of pseudo intellectual informationist army.
